Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAR39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryoric (partic. E. coli) or eukaryotic and testing of cyds. useful for treating or develop products for the design associated with beta-amyloid peptide, esp. Alzheimer's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated human amyloid precursor protein protease - used to develop prode. for the treatment or diagnosis of associated conditions, esp. Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GCAGGAGAAGAAGCCCAGGGTGACAAGATTATTGATGGCGCCCCATGTGCAAGAGGCTCC

This invention describes a novel non-human transgenic mammal or mammalian embryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneuw chymotryptic enzyme (SCCE) or its variant, or variant in skin. The product of the invention is useful as a model or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a common or a paramaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of the pridermal hyperkeratosis, epidermal inflammation, dermal inflammation, pruritus, atopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the N-terminal cynomymous with human stratum corneum chymotryptic enzyme, SCCE synonymous with human kallikrein 7 (KLKP), used in the development of the
Transgenic mammal or its embryo useful as model for human disease, has heterologous nucleotide sequence coding for stratum corneum chymotryptic enzyme operably linked to promoter that drives its expression in skin.
                                                                                                                                                  Example 6; Page 37; 74pp; English

This invention describes a novel non-human transgenic mammal or mammalian sembryo having integrated within its genome, a heterologous nucleotide sequence comprising at least a significant part of a nucleotide sequence coding for a stratum corneum chymotryptic enzyme (SCCB) or its variant, operably linked to a promoter that drives expression of heterologous scce or its variant in skin. The product of the invention is useful as a model for the study of disease with the aim of improving treatment, to relieve or ameliorate a pathogenic condition, for development or testing of a cosmetic or a pharmaceutical formulation, and for the development of a diagnostic method. It can also be used as a model for a skin disease or skin cancer. The invention is also useful for screening or identifying a

compound or composition effective for the prevention or treatment of an abnormal or unwanted phenotype, and for screening or identifying a compound or composition effective for the prevention or treatment of inflammatory skin diseases selected from diseases consisting of epidermal hyperkeratosis, epidermal inflammation, dermal inflammation, prunitus, atopic dermatitis, eczema, acne and inherited skin diseases with epidermal hyperkeratosis. The mammal of the invention is also useful as a model for further studies of itch mechanisms and the testing of potential compounds and compositions for relieve of various skin diseases where itch is a component. This sequence represents the human stratum corneum chymotryptic enzyme, SCCB which is a serine protease synonymous with human kallikrein 7 (KLK7) and is used in the development of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. restenosis and diseases and asthmal, cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal-associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. disorders, pain, sexual dysfunction, mood disorders, attention disorders, hypotension, hypertension, psychotic disorders, neurological disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzheimer, gisease, Parkinson's disease) and dyskinesias. The nucleic acids and polypeptides are also useful for treating viral infections such as ocular disease (e.g. useful for treating viral infections such as ocular disease (e.g. the novel human proteases of the invention
                                                                                                                                                                                                        protease; cancer; immune-related disorder; cardiovascular disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Nucleic acids encoding novel human proteases, useful for useful for treating diseases and disorders such as cancers, immune-related diseases and disorders, cardiovascular disease (e.g. restenosis) and inflammatory

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                The invention describes genes (1) which are differentially regulated in prostate cancer. (3) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the number is indicative of the probability that the sample comprises prostate cancer. (3) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves determining the expression levels in a sample comprising prostate tissue of target genes which are differentially-regulated in prostate cancer. Preferably, the expression levels of at least 10 genes are determined. (1) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer. (2) activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent modulates the biological activity. (1) is useful as molecular markers, as drug targets, and for detecting, determining whether the diagnosition to diseases and conditions especially relating to prostate cancer. (1) and its expression products are used in the diagnositic test to assay for presence of cancer eg., in tissue sections, in biopsy sample, in total RNA, in lymph, in bloops conditions especially relating to prostate cancer. (1) and its expression of cancer, its stage of development, the nature of genetic defect, etc. (2) is useful markers, as a farget for therapy or drug discovery. (1) can also be used for expressing the polypeptide and thus for searching specific binding partners of the polypeptide and thus for specific genes, and groups of genes, expressed in pathways in therapeutic applications to reat prostate cancer. The identification of specific genes, and groups of genes expressed in pathways which are useful in disagnositic, th
                                                                                                                                                                                                  Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     GCAGGAGAAAAAGCCCAGGGTGACAAGATTATTGATGCGCCCCATGTGCAAGAGGCTCC 135

                                                                                                                                                                                                                  The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a smaple comprising the number of tearget genes which are differentially regulated in the sample unmber of tearget genes which are differentially regulated in the sample comprises prostate cancer. (I) Is useful for assessing a therapeutic or preventive intervention in a subject having a prostate cancer, which involves concerted to the expression levels in a sample comprising prostate cancer. (I) Is also useful for identifying agents that modulate a biological activity of a polypeptide differentially regulated in prostate cancer. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially regulated in prostate cancer cells, which involves contacting a polypeptide differentially regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and determining whether the test agent under conditions effective for the test agent to modulate a biological activity of the polypeptide, and certain modulate a biological activity of the polypeptide, and certain modulate a biological activity of the polypeptide, and etermining predisposition to diseases and conditions especially relating to prostate cancer. (I) and its expression products are useful for assessing cancer (I) and its expression conditions especially relating to prostate cancer. (I) and its expression conditions especially relating for easy for presence of cancer (C) is useful for assessing cancer e.g., to determine the type conditions in bypeptide encoded by (I) can be used as target for therapy or drug for searching specific binding partners of the polypeptide and disease pathways and the delineation of targets in these physiologically relevant to prostate cancer. The identifications conditions and disease pathways and the delineations. This is the amino acid sequence of a protein dise

200 220 615 675 735 375 120 435 140 495 160 555 180 New polynuclectide and polypeptide useful for diagnosing and/or treating cancer, particularly ovarian cancer, and as a vaccine. Human stratum corneum chymotryptic enzyme - ovarian cancer clone 01676P. The invention relates to a novel isolated polynucleotide. The polynucleotides of the invention have cytostatic activity, and may have 201 CysAsnGlyAspSerGlyGlyProLeuValCysArgGlyThrLeuGlnGlyLeuValSer 316 CACCCCGGCTACTCCACACACACACTTAATGACCTCATGCTCGTGAAGCTCAATAGC 376 CAGGCCAGGCTGTCATCCATGGTGAAGAAAGTCAGGCTGCCCTCCCGCTGCGAACCCCCT 436 GGAACCACCTGTACTGTCTCCGGCTGGGGCACTACCACGAGCCCAGATGTGACCTTTCCC TCTGACCTCATGTGGGTGGATGTCAAGCTCATCTCCCCCCAGGACTGCACGAAGGTTTAC 556 AAGGACTTACTGGAAAATTCCATGCTGTGCGCTGGCATCCCCGACTCCAAGAAAACGCC 616 TGCAATGGTGACTCAGGGGACCGTTGGTGTGCAGAGGTACCCTGCAAGGTCTGGTGTCC 676 TGGGGAACTTTCCCTTGCGGCCAACCCAATGACCCAGGAGTCTACACTCAAGTGTGCAAG Human; cytostatic; gene therapy; vaccine; cancer; ovarian cancer 241 PheThrLysTrp1leAsnAspThrMetLysLysHisArg 253 TTCACCAAGTGGATAAATGACACCATGAAAAAGCATCGC 774 Claim 2; Page 157-158; 169pp; English. The invention relates to a method of detecting an ovarian cancer-
associated transcript in a cell from a patient, by contacting a
biological sample from the patient with a polynucleotide that selectively
hybridizes to a sequence at least 80% identical to any of one of 80
nucleic acid sequences given in the specification. The method is useful
in diagnoshig ownrian cancer and in identifying and using agents and/or
targets that inhibit ovarian cancer. The nucleic acid molecule,
polypeptide and the antibody may also be used in detecting ovarian
cancers, monitoring and early detection of relapse following treatment,
monitoring response to therapy, selecting patients for post-operative
chemotherapy or radiation therapy, in selecting mode of therapy,
and as vaccines. This sequence corresponds to one of the proteins used
for the detection method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               135

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various disease associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, osteoarthritis, Leber's heredicary optic neuropathy (LHON), mitochondrial concephalopathy lactic acidosis and stroke (MELAS), myoclonic epilepsy ragged red fibre syndrome (MERRP) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidiabetic, anticonvulsant, antiarthritic, osteopathic, ophthalmological and cytostatic activities. This polypoptide sequence is a human heart mitochondrial protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      255

Also disclosed is an antibody that binds to a TAT polymptide. The antibody is a monoclonal antibody, an antibody fragment, a chimeric antibody or a humanised antibody. It is conjugated to a growth inhibitory agent. It is produced in bacteria or in CHO cells and induces death of a cell to which it binds. The antibody is useful for preparing a composition for diagnosing or treating tumours and cancer. The present sequence represents a human TAT polypeptide of the invention.

                                                                                                                                                                                  The invention relates to novel polynucleotide and polypeptides for treating psoriasis or a sequence having at least 80% identity to the above sequences. The nucleic acid is useful for preparing a composition for diagnosing or treating psoriasis in a mammal. This sequence corresponds to one of the polypeptides of the invention.

The invention relates to a novel method for detecting a plurality of kallikrein markers associated with ovarian cancer. The method comprises obtaining a sample from a patient and detecting in the sample a plurality of kallikrein markers, and optionally carbohydrate antigen CA125, wherein the kallikrein markers are selected from the group consisting of kallikrein 5, kallikrein 6, kallikrein 7, kallikrein 8, kallikrein 10 and kallikrein 11. The detected amounts of the kallikrein markers are compared with standard amounts. The method of the invention may be useful for detecting kallikrein markers associated with ovarian cancer in a patient and thus for detecting ovarian cancer, particularly epithelial ovarian cancinoma. The current sequence is that of the human ovarian which is a secreted serine protease and is encoded by DNA located at

Human kallikrein 7 protein SEQ ID NO:1.

19-MAY-2005

```
The invention describes a method for detecting kallikrein polypeptides or their encoding polymocleocides, associated with neurodegenerative disease in a patient, by taking a sample from a patient, detecting/identifying one or more kallikrein polypeptides or polymocleocides encoding kallikrein polypeptides or polymocleocides encoding with an amount detected for a standard, where kallikrein polypeptides are chosen from kallikrein 7 and kallikrein 10. Nootropic; Neuroprotective; Cerebroprotective; Antiparkinsonian. The method is useful for diagnosing, detecting and monitoring a neurodegenerative disease in a subject. The method is also useful for assessing whether a patient is afflicted with or has a pre-disposition for Alzheimer's disease or frontotemporal chementia. The present sequence represents human kallikrein 7. Human tissue kallikreins are secreted serine proteases encoded by genes that are tandemly localized on chromosome 19, more specifically to region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       135
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      195
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     255
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting kallikrein polypeptides or their polynucleotides, associated with neurodegenerative disease in patient, by identifying kallikrein polypeptides or polynucleotides, in patient's sample, comparing detected amount with standard.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     75

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Lissue kallikrein (EC 3.4.21.35) submandibular precursor - mouse
N,Alternate names: glandular kallikrein; kininogenin
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: A25606, S0661
R;van Leeuwen, B. H.; Evans, B.A.; Tregear, G.W.; Richards, R.I.

Database :

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

TISSUB SPECIFICITY: Abundantly expressed in the skin and is
TISSUB SPECIFICITY: Abundantly expressed in the brain, mammary gland, cerebellum, spinal cord and kidney. Lower levels in salivary gland, cerebellum, spinal cord and kidney. Lower levels in salivary glands, uterus, thyroid, placenta, trachea and testifs. Up-regulated in ovarian carcinoma, especially late-etage serous carcinoma, compared with normal ovaries and benign adenomas (at the protein level).

Phe-|-Tyr-26, and 26-Tyr-|-Thr-27. Could play a role in the activation of precursors to inflammatory cytokines. SUBJECTIONER EACHION: Secreted (By similarity).
TISSUE SPECIFICITY: Expressed in skin and, at lower levels, lung, kidney, brain, heart and spleen. In skin, expressed in suprabasal keratinocytes and in the luminal parts of hair follicles. Not detected in liver and skeletal muscle.
SIMILARITY: Belongs to the peptidase SI family. Kallikrein subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ||||||||

"The secreted protein discovery initiative (SPDI), a large-scale

effort to identify novel human secreted and transmembrane proteins: a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and mouse CDNA sequences.",
Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: May be involved in desquamation.
-!- SUBCELLULAR LOCATION: Secreted.
-!- TISSUE SPECIFICITY: Expressed in skin, breast, brain and testis.
-!- SIMILARITY: Belongs to the peptidase S1 family. Kallikrein
                                                                                MEDLINE=20118156; PubMed=10652563;
